

AI running form coaching.

Film 12 seconds on any phone. Stride measures 11 biomechanics metrics, tells you which ones the clip can actually support, shows every fault on the athlete's own video, and schedules the drills that fix it.

ROUND

Raising \$500K pre-seed · SAFE

STAGE

Full stack shipped · 8.3s analysis · pre-launch

CONTACT

Adhiban Arulselvan · < hello@stride domain email >

Half of runners get injured every year — and the faults that hurt them are visible on video nobody analyzes.

A competitive sprinter or club runner has two options today: a \$200–500 lab session their town doesn't have, or a coach's naked eye across 40 athletes. So overstriding, weak hip extension and collapsing knees go unmeasured until they become injuries or lost seasons.

50^{M+}

Americans ran in 2024 — the largest participation sport, at its highest since 2020.

SFIA

>50%

of regular runners injured per year. Prior injury doubles the odds.

Garmin-RUNSAFE · JOSPT

\$200–500

per lab gait session, concentrated near elite programs. Form assessment barely exists below the elite level.

US commercial gait labs

Video in, coaching out — measured at 8.3 seconds.

01 FILM

Any phone, side-on, 12 s

Phone sensors correct camera tilt. In a crowd, brush-select your athlete — tracking locks on and recovers if lost.

02 MEASURE

11 metrics, with evidence

Hip extension, knee drive, overstride, contact time, cadence and more — the skeleton is drawn over the athlete's own video, synced to playback.

03 FIX

Faults become programs

Each fault maps to a drill; one tap builds a multi-week progressive program shaped to level, severity and injury status.

FORM SCORE

84 / 100

Overstriding **FIX FIRST**

Trunk angle **WORK ON**

Cadence 178 spm **TRUSTED**

Contact time **RE-FILM**

The differentiator: Stride tells you when it's sure. Every metric is certified trusted or experimental from what the clip supports — camera angle, frame rate, tracking. Competitors report every number with equal confidence. Provisional patent prepared.

\$0 raised. Full pipeline running, 8.3-second analysis, 260 tests green.

BUILT — AND PROVABLE

End-to-end pipeline running in production: film → pose → 11 metrics → trust gate → coached report → drill calendar. 14 of 14 end-to-end checks green.

Measured, not asserted: **upload to coached report in 8.3 seconds on CPU**. 260 automated tests across 41 files; 57 commits since 17 May 2026.

The trust gate is real, and it refuses: on an oblique crowd clip the system trusted zero metrics and returned zero faults rather than confident nonsense. Athlete-identity switches in multi-person clips: 53 → 0.

Named gap: no motion-capture ground truth yet. Angle accuracy today inherits from the published method we mirror (VideoRun2D, 3.2–5.5° sagittal, side-on). A 5-viewpoint mocap validation set is milestone one of this round. Provisional patent prepared.

DEMAND — LABELED PRECISELY

In pilot

◁ *N athletes across N SD track clubs/teams* ▷

LOIs signed

◁ *N coaches covering N athletes, 2026–27* ▷

Waitlist

◁ *N signups — name the channel + conversion* ▷

Discovery

◁ *N coach/athlete interviews — top recurring pain* ▷

Every demand item is labeled by strength (pilot > LOI > waitlist > interviews) — nothing soft is dressed up as commitment. Small and real beats big and vague.

Two founders who already shipped what funded teams ship.

PHOTO

FOUNDER · CEO

Adhiban Arulselvan

Built Stride's ML and biomechanics engine — RTMPose pose pipeline, 11-metric sagittal engine, phase detection, single-athlete tracker, per-metric trust gating — in 10 weeks.

Second invention: NeuroStimulate neuropathy screener — USPTO provisional filed 2026; Kaiser-recognized.

Contributor on an MIT-led patent drafting team.

Founder-market fit: we are the athletes this is built for, inside the San Diego track community it launches into.

PHOTO

COFOUNDER · ENGINEERING

Taran Bheemagani

Owns the app and the infrastructure: React Native app, Express API, and the full Terraform AWS stack — ECS Fargate, Aurora DSQL, SQS, IAM. 20 of the repo's 57 commits.

◀ 1 line: relationship to track & field / the customer ▶

ADVISORS

◀ coach / biomechanist / operator — assembling via TiE SD & SD Sport Innovators ▶

Three structural shifts converged — and the running vertical is still unclaimed.

01

COST CURVE

Lab-grade pose went commodity

Markerless 2D pose reaches ~3–5° sagittal accuracy from a single view and runs on $\approx 2\phi$ of CPU — an analysis that cost \$200+ in a lab three years ago.

02

HARDWARE

240fps cameras in every gym bag

Honest ground-contact and cadence measurement needs high-frame-rate video. It's now a default phone feature, not equipment.

03

CAPITAL PROOF

The category funds and exits

Sportsbox AI (3D golf from a phone): acquired 2026, eight figures. Ochy: \$1.7M pre-seed 2025 + adidas adiClub deal. SwingVision (tennis): 20K subscribers, \$4M ARR.

Every funded comp plays golf, tennis or distance jogging. **Sprint & running form — the largest participation base with the sharpest injury pain — has no leader.**

A \$135M obtainable wedge, computed bottom-up — inside a \$12B market.

TAM \$9.8–12.1B

Fitness apps (2025) plus the gait-analysis service spend the app replaces. Growing to \$33B+ by 2033.

Grand View / Vantage 2025

SAM ≈\$4B

US fitness-app spend (~40% NA share) — runners are its largest cohort.

Grand View Research · SFIA 2024

SOM ≈\$135M /yr

The number we're accountable to.

50M US runners × ~30% who track runs × ~15% injury/performance-motivated × \$60/yr blended ARPU

Each multiplier is a stated assumption we replace with our own funnel data — that measurement is part of what this round buys. **Top-quartile sport-analysis apps monetize far above the \$60 blend (SwingVision ≈ \$200/yr ARPU).**

Priced at the category median. Economics of the category leaders.

FREE
3 analyses / month

The scored breakdown is shareable by design — organic acquisition built into the product loop.

ATHLETE — \$9.99/MO · \$79/YR
Unlimited analyses + programs

\$9.99 is the exact Health & Fitness median (RevenueCat 2026). Annual-first paywall: 68% of category subs are annual; annual churns half as fast.

TEAM — \$499/SEASON
Coach dashboard, whole squad

One sale onboards 40+ athletes. B2B2C distribution that sidesteps consumer CAC entirely.

≈2¢

marginal cost per analysis → 90%+ gross margin at scale.

37.7%

median trial→paid conversion in Health & Fitness — 2nd best of all app categories. (RevenueCat)

\$200_{/yr}

SwingVision's realized ARPU (20K subs, \$4M ARR) — sport-specific analysis sustains ~5× generic pricing. Our upside case.

Paid ads don't work in this category. Coaches do — one coach is forty athletes.

Category paid-UA math is underwater ($\approx \$4.70$ install cost at a 2.9% paid-conversion median $\approx \$160+$ CAC vs \$36 first-year value). Our plan is built on that fact, not around it.

MONTHS 0–6

Own San Diego track

Founder-led pilots with clubs and HS programs we're already inside. Preseason roster screening converts to \$499 season licenses; every team = 40+ athlete accounts at $\sim \$0$ CAC.

MONTHS 6–12

Replicate through the coach network

Track coaching is a tight community — CIF meets, clinics, associations. 1.1M US high-school track & field athletes reachable through it. Target: 25 team licenses.

MONTHS 12–18

Organic consumer flywheel

Scored form breakdowns are native short-form content. \$50–75K of the round is explicitly CAC discovery — finding channels that clear a \$30–40 cost per trial before any scaled spend.

Model precedent: Ochy's growth lever was an adidas partnership, not ads; Mustard's was Golf Digest/TNT. Distribution partnerships are the category's proven channel — ours is the coach.

The real competitor is a coach's eyeball. We give it instruments.

Honest claim boundary: "any angle" is not defensible against guided-capture competitors — side/oblique tolerance with per-metric trust is.

18 months at \$28K/month — every dollar mapped to a milestone.

PHASE	BUILD	SELL	GATE TO NEXT PHASE
M 0–3	App Store launch · 120fps capture · mocap validation set	3 paid team pilots (San Diego)	500 athletes analyzed
M 4–9	Frontal-plane injury metrics · coach dashboard	25 team licenses via CA coach network	3,000 athletes · first renewal data
M 10–18	Personal baselines · injury-risk trends	Consumer flywheel + CAC-proven channels only	10,000 athletes · \$10–15K MRR

SEED-READINESS TARGETS — SET AGAINST CATEGORY REALITY

D30 retention 10–15% (top decile for Health & Fitness; the median is 5%) · monthly first-renewal ≥ the 57% category median · \$10–15K MRR with cohort curves. We benchmark against the published distribution — not against wishes.

BURN DISCIPLINE

2 founders at sub-market salary + 1 contract engineer · \$50–75K ring-fenced CAC discovery · ~15% contingency. Spend follows proof: each phase's budget unlocks on the prior gate.

Raising \$500K on a SAFE to reach 10,000 athletes and seed-ready retention data.

USE OF FUNDS · 18 MONTHS RUNWAY

Product & ML — founders + 1 engineer	40%
Go-to-market — pilots, coach network, CAC discovery	30%
Operations & launch	20%
Infrastructure, legal & utility-patent conversion	10%

WHAT THE ROUND PROVES

- 01 A repeatable coach-led sales motion — 25 team licenses.
- 02 10,000 athletes with cohort retention in the category's top decile.
- 03 \$10–15K MRR at category-median pricing — seed raised on curves, not narrative.
- 04 Mocap-validated accuracy, and a utility patent filed on the trust-gated engine.

Every athlete deserves to see their own form.

Starting with the sprinters who need it most — building the measurement layer for human movement.
